BIKE

pump track

Most of the population likes to communicate and move. So, it is hardly surprising that we are increasingly looking for sport activities not only in clubs but also in everyday life. Modern sport facilities are both social meeting-points and open spaces for movement. Our concepts for pump tracks take up this philosophy.

When we speak of bike and skate sports nowadays, we speak of a broad social acceptance, as well as a huge following of young activists. The number of new riders in the field of biking and skating has been constantly growing for years. A development which depends on the increasing urbanization of sports with demand-oriented sports facilities.

It is an indisputable fact that an offer of freely accessible sport facilities provides great benefits for both human health and society. At this point, together with you, we would like to think in a new and most of all contemporary way. What priorities have you set for your city, community or tourist region in terms of promoting physical activity and the attractiveness of your location and do these priorities allow you to address children, young people and adults? When it comes to your offer for a modern society, what needs to happen to create attractive sport facilities within and to the benefit of your region?

How are you already perceiving this change in the open space and what does the future of individual sports look like for you?

Immerse yourself into the world of pump tracks and let yourself be inspired by our solutions.

The pump track as a communal sport facility

SPORTSGROUND2.0

Looking at municipalities and sport facilities in Germany and Austria, many similarities can be seen: Under high pressure to adapt and change, both must face a variety of challenges such as demographic change, changes in educational policies, shifts in sport interests, structural crises in public financing, etc. The logical conclusion is that both areas support each other in solving these problems.

The asphalt pump track manages this balancing act as it is a future-oriented sport facility, a so-called sports ground 2.0.

Modern sport facilities focus mainly on topics such as attractiveness of the location, education, health and social integration. Thereby the requirements for a sports ground 2.0 become clear:

It must be long-lasting, offer a high social added value (a good social return) and at the same time be versatile and attractive for as broad a user group as possible.

Municipalities need a long-term location for many types of sport, instead of multiple facilities accommodating only one type of sport at a time.

The pump track meets exactly these requirements:

- Variety of user groups: mountainbikes, non-mountainbikes, skate & longboard, BMX, scooters, balance bikes, inline skates.
- Asphalt pump tracks are low-maintenance, safe from vandalism and therefore extremely durable as municipal sport facilities.

Riding a pump track is simple, intuitive and fun for all ages.

Various rolling sports can be carried out across generations on one course, regardless of ability and riding style. The pump track serves as a multipurpose sport facility for municipalities and is therefore the best way to promote physical activity.

The motto is:

“Turn off your phone, drop the burger and hop onto the pump track.”

Pump tracks as a cure for social and health related problems in young people

Riding a pump track is a sport that encourages movement, which can be easily proven thanks to the way it is constructed. Modern counting systems show the great influence such a sport facility has on the users' sport motivation.

The combination of movement, fun, safety and the variety of user groups makes these facilities unique

From a planning point of view for municipal sport facilities, there are significant advantages regarding the pump track

• Diversity of user groups:

- Mountainbiker
- Non-Mountainbiker
- Skate- & Longboard
- BMX
- Scooter
- Balance bikes
- Inline Skates
- Wheelchair

• Safety:

According to the Swiss Council for Accident Prevention, pump tracks are classified as “blue” sport facilities equivalent to children’s playgrounds.

Educational institutions such as kindergartens, schools and universities benefit from the pump track

• Creation of a modern and multifunctional facility.

• Movement is actively and unconventionally promoted.

• Sport activities are consciously offered and encouraged.

• Increasing the attractiveness of educational institutions.

• Possibility of combining study and recreational time.

• Place of encounter and personal fulfilment.

Bike

Target groups of pump tracks

It is not without reason that the asphalt pump track is referred to as a multifunctional sport facility. Due to the characteristics of the facility, an extremely broad target group is reached, making it the perfect prerequisite for an urban / municipal sport facility.

Asphalt pump track

The use of asphalt as a track surface provides the ultimate all-purpose solution for multifunctional roller sports facilities. Particularly in urban areas, asphalt surfacing has become an integral part of modern concepts developed for sport facilities. Compared to natural and paved facilities, the higher acquisition costs are put into perspective by the crucial advantages of the asphalted versions. Especially when longevity and minimal maintenance are vital criteria, asphalt is the only construction material to be considered.

ADVANTAGES:

- Low maintenance
- Can last up to 25 years, provided it is looked after properly
- Multifunctional for many roller sports
- Clean and urban look
- Highest traction and low rolling resistance
- Rideability even in wet conditions
- Fast-drying
- Frost-resistant
- Color design possible
- Less expensive than constructions using concrete
- Design/form independent of base area

recommended

Asphalt pump tracks are very quiet

Noise pollution is a major concern when it comes to sport facilities in public spaces and especially for those that are specifically designed for a young target group. In this respect, too, the asphalt pump track scores highly due to its low noise pollution.

Noise sources and their sound power (SWL)

Pump track

Wals-Siezenheim

- Year of construction: 2017
- Base area: 2.100 m²
- Asphalt surface 870 m²
- Number of laps and kilometers: July 2017 – Sep. 2022
approx. 4,3 million laps and 310.000 km

Pump track

If there is a bike park literally providing endless fun, then it is the pump track. The aim is to ride the pump track with its waves, curves and jumps in an infinite loop through dynamic up and down movements—the so-called “pumping”—and to generate speed without pedaling or pushing. Once this principle is taken into account, there are no limits on how to design a park. Therefore, countless forms of pump tracks can be built. The layout can be individually tailored to the terrain and, thanks to its similarity to parks, it blends perfectly into the modern cityscape. As an urban sport facility, the pump track also impresses with its high level of safety.

Since the riding ability determines the maximum speed, this type of facility is considered very safe and has the same hazard rating as children's playgrounds. If the pump track is paved, it is not only very low maintenance and safe from vandalism, but also becomes accessible for many types of users such as skateboarders, longboarders, scooter riders, inline skaters and even people in a wheelchair. Summarizing these aspects, it becomes clear that the pump track is not solely a simple facility for bike sports, but the most versatile multi-sport system for roller sports available to date.

Balance bike track

The balance bike track is the “little brother” of the pump track being an ideal, playful introduction to cycling for children from about 2 years of age. The circuit with its low waves is the perfect and safe place for small children to train and further develop their coordination skills on balance bikes. In this context, they not only improve their body

awareness, but also develop an initial understanding of how to behave in groups. From a construction point of view, the wheel track is particularly attractive due to its relatively small size, which means that it can be integrated into practically any location.

Jump track

This part of a pump track is characterized by a perfectly coordinated sequence of jumps with variable levels of difficulty. The jumps are usually built in such a way that they can be rolled over, meaning that not only advanced riders and professionals can be attracted as a target group but also beginners. For many young riders, the jump track is often one of the highlights of pump track facilities. With its exciting jumps this media-effective instrument attracts numerous spectators and is perfectly suited for show events. Thanks to a sophisticated design of jumps, safety does not fall by the wayside.

Our services

One of the core elements of action sports is creativity. This requires creative and professional sports facilities. This is what we are specialized in: skateparks, pump tracks, bike parks and similar parks that appeal to children, young people and sports enthusiasts. After a long project duration no municipality should find out that the facility is not being accepted by its users. 20 years of being in the action sports business give us an understanding of what skateboarders, scooter riders or any other action sports fan wants and we pass this knowledge on to our customers as a specialized planners.

Are you looking for departmental planning for skateparks or a pump tracks? With years of experience from numerous projects, we design any project as an individual roller sports facility that perfectly fits the budget and space available. As a flexible planning service we offer the service phases 0 - 5 according to HOAI.

Quick facts

-  Innovative designs for action sports parks
-  Specialized planning for skateparks, pump tracks & co.
-  Up-to-date and target group oriented facility planning
-  Service phases 0 - 5 according to HOAI

Worldwide Projects

- **510+ Snow park projects**
- **16.500+ Obstacles**
- **135+ Bike projects**
- **66+ Skate projects**
- **36 Countries**
